

1, Explain uses of ping command in network ?

Ping command is used to check that N/w is established or not

2, Explain netbios protocol ?

It's a network Protocol which allows to communicate with other computer using names.

3, Explain SMB protocol ?

Sharing Files within network is called SMB Protocol

4, Explain ping process from 50.0.0.10 to 50.0.0.20 ?

Let's assume PCA - 50.0.0.10 ; PC B - 50.0.0.20

PC A checks that PC B is in same local network or not

PC A needs PC B MAC address; Since MAC is local and IP is

PC A still didn't know the MAC address so it Broadcasts in which PC B responds to it. Now PC A stores the mapping

PC A now creates Echo request

PC B receives the request and sends a response back

PC A receives the response and it can calculate it

This is how Ping process is done.
